

Panelized Wall Systems are advantageous to the environment in many ways.

Wood construction in general has the following benefits on the environment, compared to that of concrete or steel:

- Minimizes air and water pollution
- Lower green house gas emissions
- Lower solid waste by-products
- Less energy and water used
- No “off gassing”
- Wood can be recycled and reclaimed in the future

Panelized Wall Systems reduce the effect on the environment by reducing:

- On-site waste
- Amount of lumber used during manufacturing
- Soil disturbance on job-site
